Abstract (en)

[origin: WO9711247A1] This invention relates to a method of glazing-in an open space, a plurality of rectangular or square units being found, which comprise a glass-pane and/or a plastic pane, and the units being intended to move in upper and lower longitudinal rails. According to the invention the method is characterized by the following steps: the units (57-59) are conveyed along the rails (60, 61) and are brought to pass one or more 90 DEG corners, constituting a connection area for two adjacent rails (60, 61), which form a 90 DEG angle with each other; the units (57-59), when opening the space, glazed-in, are conveyed towards the end area of the one rail (61), each unit being turned out in that way that it is held in position in the upper and lower rail by two means, arranged essentially straightly above each other, and is then parked close to the unit, being in front of the former one. The invention also relates to apparatus for glazing-in the open space.
