Abstract (en)

[origin: WO9705287A1] A method of monitoring heat processes in pharmaceutical, clinical, food or non-biological products, which method includes the steps of combining a test sample or sample extract from the product with chemiluminescent compounds or compounds specifically susceptible to enzymes, while triggering the decomposition of the chemiluminescent compound to emit light. The enzyme can be indigenous or added before the heat process as an indicator. The sample is incubated and integration of chemiluminescent light emission over time is measured as indicative of the past temperature and time profile of the sample.
