Abstract (en)
[origin: WO9805842A1] The invention concerns a sliding fitting (10) comprising a guide groove (12) and a stop side (11) for a device equipped with a drive mechanism for a sliding door, for use in a door. A sliding piece (20) which is in contact with a drive for a door is mounted in the guide groove (12) so as to be able to slide in an axial direction. At least one sensor which scans the danger zone of the displacement area of the door and is in contact with the device for closing the door is allocated to the door area. The sliding fitting (10) has a zone (30) adjacent to the guide groove (12) containing the sliding piece (20) which receives at least one sensor to monitor the danger zone of the door. The zone (30) can be fitted beneath, in front of or behind the guide groove (12).
