Abstract (en)

[origin: WO9713643A1] A device for supporting a comb binder (3) to enable perforated sheets (F) to be placed thereon is disclosed. Said binder has the form of an elongate channel and consists of a comb with transverse curved teeth (D) divided into pairs by gaps (I). The device comprises a set of supporting tabs (5, 5') arranged in pairs, and at least one tab in each pair is movable relative to the other tab so that in a first mutual positioning mode or retracted mode, said tabs can be inserted into the gap (I) between two adjacent teeth (D) of the binder (3), whereas in a second positioning mode or deployed mode, said tabs engage said teeth (D) and thereby support the binder (3). A binding machine provided with said device is also disclosed.
