Abstract (en)
[origin: EP0855350A1] A dispenser consists of a reservoir for a pressurised product, re-filled from a container (41). The reservoir has first (4) and second (13) valves which are arranged in line with one another and in opposite directions, and an actuating and dispensing element (21). The two valves can be opened and closed selectively and have a return spring (27) which, in the absence of any commands holds the valves closed. The two valves are fitted in the same housing (11) which is in communication with the reservoir, and they are actuated by projecting stems (15, 20) which are rocked or depressed.
