Abstract (en)
[origin: EP0855520A1] The valve member (8) has an activation surface (42), which for movement of the valve member is activatable with a control medium under operating pressure, which is feedable from the pressure medium source via a control channel (43) governed by a control valve (3). Connected in the control channel is a pressure regulator (58) for creating the operating pressure. The pressure regulator is connected in the inflow side channel section (38) of the control channel (43) ahead of the control valve for the pressure medium source. The pressure regulator is not adjustable and simply provides a specific operating pressure, or it can be stagelessly adjustable for provision of different desired operating pressures.
