Abstract (en)
A fire alarm system comprises control panel 13, first and second two-wire alarm circuits 17,18 extending from the control panel 13 into respective zones, each alarm circuit comprising a plurality of combined detector and sounder devices 10 connected in parallel across the wires 11,12 of the circuit. Upon detection of smoke or heat in one of the zones, the activated device 10 is arranged to draw a pulsed current from the control panel 13, which can be detected to trigger an alarm condition in the control panel 13, whereupon the control panel 13 applies an alarm signal circuit to the alarm circuits 17,18 of both zones, so as to energise the sounders of all devices 10. The pulsed current that is drawn by the devices 10 when they are activated by heat or smoke means that any further change in current that is caused when more devices 10 are activated as the fire spreads will be detected by the control panel 13, despite the heavy current being drawn by the energised sounders. <IMAGE>
