Abstract (en)

[origin: EP0857681A1] The assembly for the movement of flat printed materials has at least one main conveyor (10), moving past at least one feed point (20). It has a longitudinal holder (14) to take the material (16) at the feed point (20) at a holding plane (18) for the material (16). A feed conveyor (22,23) has a number of controlled clips (28) which move in the feed direction (Z) on a closed loop path (30) past the feed point (20), to give a controlled transfer of the printed material to the holder (14). The movement path (32) directly before the transfer point, on the closed loop path (30), is at an angle to run from the closed loop path (30) on a straight line (42) parallel to a clamp jaw plane and at right angles to the clamp jaw line with an enclosed angle (β , β') which is acute or obtuse. The straight line (42) is generally parallel to the holder plane (18).
