Abstract (en)
A joint sealing device comprises two elongate components (20,26), each of generally uniform cross-section throughout its length. The first component (20) comprises, in cross-section, two parts (23,24) interconnected by a linear hinge (22) to enable the parts (23,24) to fold towards each other. The mutually remote faces of those parts (23,24) are at least partially covered by a resilient material (25). The second component (26) is adapted for insertion between the parts (23,24) to urge them apart and is adapted to engage and be retained by locking means (28,29) on the first component (20). <IMAGE>
