Abstract (en)

[origin: EP0857846A1] Clamping bracket (20) for fixing two adjoining wall profiles (1, 2) to each other, each wall profile having a pair of channels (11, 12) which extend in the lengthwise direction of the profiles (1, 2) and have openings situated opposite each other. The clamping bracket consists of a rigid coupling piece (21) and a resilient coupling piece (22) parallel thereto. The coupling pieces (21, 22) are fixed to each other at their centres by means of a connecting element (23), relative to which at least one coupling piece (21, 22) is rotatable about an axis which is situated perpendicular to the coupling pieces (21, 22). The length of the resilient coupling piece (22) is greater than the distance between the bottoms of the channels (12) in which it is placed. After placing of the coupling pieces (21, 22) in the corresponding channels (11, 12), the resilient coupling piece (22) can be moved towards and away from the corresponding profile (2), with the result that it clicks into a concave and convex form respectively. <IMAGE>
