Abstract (en)

[origin: EP0858178A1] The method involves several digital audio signals, originating from a range of different sources. The audio signals are fed to the inputs (1-m) of a group of processing units (10-13), e.g. digital signal processors. The processors are controlled by a user terminal (27) and the outputs are received by summing modules (17-20) with converters (24) that are coupled to a summing bus system.
