Abstract (en)
[origin: WO9743886A1] In an electrical connector for connecting electric terminals (4) of a component (3), especially a semiconductor component, to corresponding connecting leads (5), especially on a printed circuit board (2), there is a spring device (14) with electrically conductive through components (16) between the connecting leads (5) and the movable contacts (8). One end of these through components (16) is connected under pressure to the connecting leads (5) and the other to the contacts (8). The contacts (8) take the form of an end-pivoted pressure lever for the spring device (14).
