Abstract (en)

[origin: EP0858889A2] There is at least one blow tube (4) extending parallel to the axis of the printing cylinder (2) and over the sleeve face, in front of the dust removal system (5) in the conveyor direction (13). The blow tube has openings directed against the conveyor direction so that a blow air stream is provided which is directed in the blow direction onto the sleeve face of the printing cylinder and the transfer area at the front on the same cylinder. The blow tube can have at least two rows of openings. One row produces a force through the blow stream towards the transfer area and the second row produces a force in a sector of the sleeve face of the cylinder.
