Abstract (en)

A method for supplying a multicomponent fluid in which a first fluid component is brought to flow in a first stream, and a second fluid component is brought to flow in a second stream, wherein the second stream is brought to essentially encircle the first stream. A device for carrying out the method which comprises a first hollow body (10) provided with at least one outlet conduit (20,21,22); a second hollow body (30) having at least as many outlet apertures (40,41,42) as there are outlet conduits of the first hollow body; whereby each conduit is introduced into one aperture, there being an interspace (50,51,52) between the conduit and the edges (60,61,62) of the aperture. <IMAGE>
