Abstract (en)

[origin: EP0860550A2] The base (1) is countersunk in the ground and has vertical walls, also a cover (2) with an opening for the tree-trunk, which rests on the base. The base consists of modular blocks (4-7) fitting together via mating protrusions and recesses at their top and bottom surfaces. The blocks are prevented from sliding in relation to each other without use of an additional bonding agent. The topmost layer of base blocks can be shaped so as to give safe positioning of the cover, typically having parallel or truncated-cone protrusions against which the cover edges bear.
