Abstract (en)  
[origin: WO9719244A2] The invention concerns a closure with a lock casing which can be mounted on a door or window and in which at least one bolt is displaceably mounted. The closure further comprises an engagement housing which can be mounted on a frame and into which the bolt is introduced in the closed position. A secure key-less lock which is easy to handle is produced in that, in the closed position, the bolt engages with an associated holding element provided in the engagement housing such that the bolt is prevented from being moved by the handle into the open position. In order to release the locking connection, an actuating member is provided which can be guided out of only one rest position against spring pretension. The bolt can only be moved by the handle into the open position when the actuating element is simultaneously held in its position in which the locking connection is released.
