Abstract (en)  
[origin: WO9721066A1] The invention concerns a mine-clearing vehicle comprising a front attachment (1) which is operatively connected via hydraulic or pneumatic cylinder-piston arrangements (2), and optionally via frame pieces (4) pivotably articulated on the vehicle (3), to the latter such that the attachment can be raised and lowered. The front attachment (1) comprises a casing (5) which is at least open at the bottom or at least partially open. In the casing (5) a first grinder drum (6), which is preferably rotated hydraulically, is disposed substantially transversely to the direction of travel (7). Provided in the region behind the first grinder drum (6) at a spacing therefrom and with its axis of rotation substantially parallel thereto is a second grinder drum (8) which is also preferably rotated hydraulically.
