Abstract (en)  
[origin: WO9720448A1] The invention relates to updating properties of a card unit (SUBn) in an electronic apparatus, especially a telecommunication apparatus, with new properties. In order for the updating to be performed flexibly without a need to anticipate future properties during the manufacture of the card unit, the new properties are formed on a separate additional card (AB) that is attached in parallel with the card unit (SUBn) and functionally connected to the card unit by allocating data corresponding to the new properties in available time slots of a time-division bus (BUS2) formed on the card unit.
