Abstract (en)

[origin: WO9717023A1] A matrix material (12) containing a polysaccharide component is fused to tissue (T) by first placing the matrix material (12) over a target location (W) on the tissue (T) and then applying energy to the matrix material (12). The polysaccharide component is of a type and the energy is applied in an amount which together result in fusion of the matrix to the tissue.
