Abstract (en)
[origin: EP0866014A2] The present invention relates to a hairiness control device in an auto winder that rewinds yarn Y which has been wrapped around a supply bobbin 1 into a package 8, said auto winder provided with a friction disk-type false-twisting device located on a yarn path between a supply bobbin and a package. The hairiness of the spun yarn wrapped into the package can be suppressed and controlled. Further, during high-speed winding (in excess of 1000m / minute), it is possible to wind a cone package and control hairiness without negatively effecting the winding process. <IMAGE>
