Abstract (en)

[origin: EP0866207A1] The casing comprises an opening (3) which is driven by a motor with both directions of rotation (B1,B2). The motor is controlled by a pair of switches (S1,S2) for each of its directions of rotation. The switches are integral parts of the motor and are operated by remote control (6). The remote control has two levers held in an inoperative position by springs. Outside the motor, is a flexible connection (14) running over a drive drum which has a manual rotation drive component whose ends are attached to each of the levers.
