Abstract (en)

[origin: EP0866524A2] The connection device uses a number of adjacent termination units (1) each having a carrier with 2 interconnected spaced rows (3,5) of termination elements (4), alternating with further termination units (14) of similar configuration. The connections between the automation device (16) and the external lines (22) for an external device (22) are provided by connecting the output terminals of the atomisation device to the termination elements in the parallel first rows (3) of the termination units and connecting the external lines to the corresponding termination elements in the parallel second rows (5).
