Abstract (en)
[origin: EP0866576A2] The RDS receiver (2) decodes RDS information detected by an aerial (1) to provide traffic message channel (TMC) statements. These can be in the form of warnings about delays, accidents, etc. The decoded messages are fed to a control unit (3) that checks the location information relative to the vehicle position as determined by a navigation system (5) and allows the data to be stored in a memory (4) and automatically retrieved when appropriate.
