Abstract (en)

[origin: EP0867359A1] The life saving device for a person fallen in the water comprises a cover (1) forming an envelope with an opening and closing flap (2). The cover receives a floating device (3) connected to a first end-piece (4). The cover comprises in its upper part means (5) for fixing in a support and in its lower part a hole (6) for passage of a second end-piece (7). A first end (8) of this second end-piece projects outside the cover and is connected to the support. The second end (9) of this piece extends into the cover and forms a loop on which is engaged a winding/unwinding reel (10) for the first end-piece connected to the floating device. The life saving device is simple and easily used.
