Abstract (en)
[origin: EP0868867A2] The cupboard has a pull-out frame (2) mounted on two spaced apart telescopic rails (5) and having a holder (7) for front cladding (18) mounted on the front. Between the frame and the front holder are two spaced apart, fixed pivot bearings (11) with a shared pivot axle (12) at right angles to the pull-out direction. A first perforated plate (20) joined to the holder has a second perforated plate (21) parallel to it. The two plates have holes around the pivot axle and on a shared circle arc so that the angle between the cupboard (15) pull-out direction and the main plane, along which the front cladding extends, is adjustable. The angle is adjustable in discrete steps by connecting the two plates with a connector (24) which fits into a pair of overlapping holes and which block the pivot bearing.
