Abstract (en)

[origin: US6152004A] An apparatus for the stack formation is described, by means of which a practically continuous individual stack formation is possible from a stream of slices produced by means of a cutting apparatus. For this purpose a partial stack is formed by means of a stack receiver, and is transferred for the further stack formation to a portioning band, so that, during the continuation of the stack formation on the portioning band, a return guidance of the stack receiver can take place into a position from which it can be shot anew into the stream of slices for the formation of a next partial stack.
