Abstract (en)
The joist for formwork (1) is characterized in that its cross section comprises a part of more thickness and a part of smaller thickness, forming a T-shaped profile. It also comprises means (A, B) for its coupling to the joists (1) adjacent to it in longitudinal direction, constituted by a first coupling element (A), provided at one end of the joist and provided with a hole (14), and a second coupling element (B), provided at the other end of the joist and provided with a pin. A joist is provided that facilitates the disassembly, since it only has a small part of its vertical wall in contact with the panel in the moment of the disassembly. <IMAGE>
