Abstract (en)  
[origin: EP0869244A1] The locking mechanism has an adjustable bolt (7) for a sliding door, window or similar with a bolt carrier (4). The carrier has at least one slot (5) to receive the shank (6) of the bolt, which has at least one hook (8a, 8b). The bolt carrier is designed to slide transversely relative to the slot to enable the hook(s) to engage with or disengage from a catch plate on the fixed surround of the door or window. The bolt is made so that it can be moved lengthwise in the slot to adjust its position relative to the catch plate, and it is fixed in position by means of an aperture (21) extending in the same direction as the slot and a locking screw (16) which engages with the edges of the aperture. The bolt can have either one aperture in line with its lengthwise axis or two apertures lying symmetrically relative to the axis.
