Abstract (en)  
A pager has a starting condition memory (9m). In this memory (9m), subprograms which are invalid in normal cases, received data, and subprogram starting conditions which are fulfilled when specific data is input from a key input section, are listed in association with each other. When one of the subprogram starting conditions stored in the starting condition memory (9m) is fulfilled, a corresponding one of the subprograms is started to execute a message display control process, an alarm control process and/or the like. <IMAGE>
