Abstract (en)
[origin: EP0872608A2] The holes (5) of the inner and extension front shells (2,3) together with an insulating body (4) run slightly inclined in relation to a normal on the front surface. The hole of the inner shell or the extension front shell is conically widened on the entry side. The holes (5) have a circular cross-section and the connecting anchor has a quadratic cross-section. The size of the circular diameter is between that of the quadratic side and quadratic diagonal. The insertion of the connecting anchor (6) can be effected from the side of the extension front shell (3) but also can be from the side of the inner shell (2).
