Abstract (en)

[origin: EP0872612A1] An element for the locking of fencing panels in welded net to a vertical hollow post (30), comprising a shaped and deformable spring (1), comprised of a segment folded to V-shape connecting a pair of extremities (13,14) folded to arc-of-circle shape, which is inserted into horizontal notches (17) in said post (30) to lock by means of each said arc-of-circle extremity (13,14), a first vertical extremity rod (8,9) belonging to each of the said panels into the hollow formed by a flap (20,21) and a side (11,12) of the post (30), by pressure exerted by the elastic return of the shaped spring (1). The invention moreover relates to a method for the erection of fencing panels in association with the locking element.
