Abstract (en)
[origin: WO9719630A1] The invention relates to a suction device for cleaning having a collecting container which has a closeable suction inlet (11), a suction outlet and a valve (30) therebetween and is connected to a suction unit by way of a suction line from the suction outlet (12). The suction line can be closed by an outlet valve (30) and a external air supply closeable by a supply valve is arranged on that side of the filter (13) which faces away from suction inlet (11). The invention proposes to develop said suction device in such a manner that it allows simple, implementable filter dedusting in that it comprises a valve link unit which links closing of the inlet valve associated with the suction inlet and/or opening of the supply valve with closing of the outlet valve (30).
