Abstract (en)

[origin: GB2308039A] A telecommunications system (100) includes a service provider (200) providing a plurality of services to a plurality of terminals (400, 401, 402). A controller (300) having a user identifier stored therein can be associated with a reader in the terminal for reading the user identifier. A selector in the terminal (400) selects one or more of the plurality of services to be associated with the user identifier. A transmitter transmits to the service provider (200) user-service information corresponding to the user identifier and information as to the selected services. The service provider (200) receives the user-service information and determines from which service provision area the user-service information was transmitted. A service provision controller determines that a particular service is to be provided to the user and a determining means determines whether the particular service is included in the first set of selected services. A paging message having paging information corresponding to the user-service information is then transmitted to the service provision area. The terminal (400) receives that paging message and responds to the service provider (200) if it can accept the service.
