Abstract (en)

[origin: EP0874118A2] One of the normally active double doors has an anti-panic lock with catch bolt (1), while the other door is normally inactive and also has a counter-lock (2) with anti-panic lock. The counter-lock has a top and bottom edge bolt (3,4) with drive mechanisms and a striking-plate opening (5) for the catch bolt. The counter-lock has a horizontally movable ejector (6) ejecting the catch bolt out of the striking-plate opening. The connections for the top and bottom edge bolts with their drive mechanisms are formed by threaded points (7) on the ends of the edge bolts facing the counter-lock. The threaded points are screwed into nuts (8) which are fixed into the drive pieces (16,17) of the edge bolts.
