Abstract (en)

[origin: EP0874200A1] The system has a generator circuit (1) and a load circuit (2) with a common inlet line (4,8) and a common return line (5,9) connected via a hydraulic switch (3) and at least one arrangement (7) for controlling the volumetric flow (VE) in the generator circuit. One or more temperature sensors are used to enable the direction and magnitude of the volumetric flow through the hydraulic switch to be determined in all cases. The volumetric flow in the generator circuit is regulated to minimize the flow (VW) through the switch.
