Abstract (en)
[origin: EP0875643A1] The stop body (1) has a hub body (4) for accommodation of a fixture component and a hollow cylindrical cover part (6) connected with hub body via a base part (5), concentrically encompassing it. The cover part (6) has a recess (10) penetrating its wall radially, which is open against the introduction direction of the fixture part to the face side of the cover part. The recess extends from the face side of the convert to the base part, and is rectangular. Two opposing sides (19) of the recess run parallel to the longitudinal axis of the stop body. The recess extends over a peripheral area of the cover part, corresponding to 0.2 times to 0.8 times the outer diameter of the cover part.
