Abstract (en)
[origin: WO9726947A1] An ice-skating boot with a high upper, used in particular for sports' purposes, requires greater space for the ankle to allow intensive forward inclinations. To that end, according to the invention, the closure edges in the top region of the upper project convexly in the direction of the centre plane of the foot, so as to enlarge the surface. The closure parts are disposed towards the front so as to vary their tension effect. Linings or padding can further be provided in the region of extensions.
