Abstract (en)
[origin: WO9712088A1] A particulate product for treating, in an aqueous medium, textile articles at least partially formed of optionally coloured cellulose materials, to modify their surface state and/or their shade is described. The particulate product comprises a foamed perlite forming an adsorption substrate, and one or more cellulolytic enzymes adsorbed by said substrate. The textile articles of interest are, for example, fabrics, knits, some non-woven fabrics, trousers, skirts and other textile products.
