Abstract (en)
[origin: EP0876959A1] The machine for the preliminary sorting of recycled materials, especially from the household or commercial sectors, has a drum device (1) which can be rotated about a substantially horizontal axis. The device has arms (30) which extend in a radial direction from the axis of rotation, and a mechanism inside the drum can move each arm to and fro in a radial direction so that each arm can be individually extended through a hole in the drum matching its cross sectional shape and then retracted.
