Abstract (en)  
[origin: WO9806465A1] This invention pertains to a snowboard securing device and the related boot. Boot locking and unlocking is made easier thanks to a securing device provided with a securing plate (5) which comprises, in the middle part of the sole length, lateral locking parts on both sides of the sole and is linked to an orbital base plate (6). The securing device has flare-shaped holding parts and a tilt-up springy fastening bow (1), the ends of which are inserted into holes (4) provided on the sidewalls (3) in a mainly horizontal plane and stick out inwards, so that one boot can be locked with a securing part using either both ends of the springy fastening bow or parts related thereto, and unlocked by tilting said fastening bow (1). The invention related boot has an assembly system (12) extending laterally upwards from the middle part of the sole (14) and is preferably made of a harder material than the shoe body (11).
