Abstract (en)

[origin: DE19508730C1] A vehicle assembly (VB) comprises at least one separate vehicle (EF) which can be identified individually. The configuration (AKON) of a vehicle assembly (VBx) currently observed is determined and checked for conformity with relevant train-announcement data sets (VM). If there is conformity with precisely one train-announcement data set, this set is allocated to the vehicle assembly (VBx). If several or no data sets are in conformity, the train-announcement data set (VM4) to be allocated to the vehicle assembly (VBx) is determined by identifying the separate vehicle (EF4).
