Abstract (en)

[origin: EP0878217A1] The support plate for the secure fixing of the front end of a ski boot is fitted with a boot restraining part (8) by a part of the sole (10). The support plate is compressible so as to adapt to variations of thickness of the sole clamped between the plate and the restraining part. A resilient body (12) is pre-compressed between a rigid movable part (1) which supports the sole and a rigid base (11) connected to the ski for limiting the deformation of the resilient body. This base has a rigid surface opposing the free deformation of the resilient body so as to constituted a non linear system, the resistance of which to pressure is relatively low in a first stage of deformation and higher in a second deformation stage.
