Abstract (en)

[origin: EP0878584A1] The coupling bush (6) works in conjunction with a second coupling bush (7), of which one half is similar to the first coupling bush and the second half is so formed that it fits in a sealed manner over an end part of the first coupling bush. The remote coupling bush half is provided with at least one bayonet groove evolving from the head end edge, which works in conjunction with a radially outwardly extending pin at a point between the ends of the first coupling bush. Two radially outwardly extending pins are formed by the ends of a pin (9) extending diametrically through the first coupling bush. The second coupling bush is provided with two bayonet grooves.
