Abstract (en)
[origin: EP0878599A2] The lock has a latch (2) which can be pulled from its locked position against the force of a spring (2a) by a lug on a profile cylinder. It also has two additional bars (5) with which a door can be locked, and which can be moved in opposite directions by a handle only after the latch has been pulled back. The latch and the bars can be moved from their locked positions by an emergency handle on an emergency release. Both the handle and the emergency handle are arranged on a common axis (9) of rotation.
