Abstract (en)

[origin: WO9728860A1] A snowshoe including a stiffening frame with two longitudinal members (1, 2) joined together by end cross-members (3, 4) is disclosed. The longitudinal members (1, 2) are substantially parallel and extend substantially along either side the intermediate area of the snowshoe where the boot is located in use. In the central area of the snowshoe, the longitudinal members (1, 2) project below the general supporting plane defined by a central webbing (5) and side fins (13, 14), and support serrated blades (29, 30) that project below the lower edge of the longitudinal members (1, 2) to provide effective grip on hard snow or ice.
