Abstract (en)
[origin: WO9728871A1] The invention relates to a kite (2) having a cover sheet (6) which is bordered on the periphery by an edge (18) supporting and accommodating the functional joints and members of the kite (2). Since all the functional joints and members of the kite (2) have been moved towards the peripheral edge (18), the surface of the cover sheet is free of any joints, openings or the like, i.e. the form of said surface can be artistic at will. In contrast to a painted cover sheet, high quality motifs which are aesthetically very attractive can also be permanently applied in a particularly rapid and economical manner e.g. by silk screen printing. Moving the attachment points (AN) of the flying lines to the outer ends of the frame (4) is particularly advantageous in that when the kite (2) is hung on the wall as a work of art, said flying lines do not hang down over the front of the cover sheet (6) with the applied motif and spoil the overall effect. Despite the move away from traditional and currently advocated structures, flying a kite designed according to the teaching of the present invention poses no problems.
