Abstract (en)
[origin: EP0879918A1] Widening devices (V) for both withdrawal boards (A) are permanently installed in the built-in board, with which a working width (2xb) of the built-in board corresponding to at least double the basic width with the withdrawal boards moved outwards is adjustable. Each widening device has a widening part (T) connectable to the outer end (5) of the withdrawal board and a coupling mechanism (M) for the widening part. The widening part is adjustable into a passive position connected with the withdrawal board within the width limit of the end. The coupling mechanism is releasably formed.
