Abstract (en)

[origin: WO9730252A1] The present invention concerns a lock armature, particularly for a garage door (7), where the lock armature consists of a handle (1) on the outer side of the door for actuating at least one door bolt (12) on the inner side of the door and a closing cylinder (3) for locking or unlocking respectively, the door bolt (12). The interaction between the handle (1) and the door bolt (12) is effected essentially by means of a four-edged pin (5), so that a bolt (6) can be slid via a drive pin (31) of the closing cylinder (3). The bolt (6) is either engaged with or disengaged from the four-edge pin (5) and either directly locks or unlocks it.
