Abstract (en)
[origin: FR2755530A1] The invention concerns a display device comprising a lighting source emitting a radiation I_s and a spatial modulator lighted by the radiation I_s , said modulator consisting of a matrix of $N \times M$ elemental pixels $(X_{i,j})$ of $dN \times dM$ dimensions, the pixels $X_{i,j}$ and $X_{i+1,j}$ being separated by a step pN . The device further comprises, means for collimating the radiation I_s in each pixel and the step pN is greater by at least one order of magnitude than the dimension dM . The invention is applicable to flat television screen.
