Abstract (en)

[origin: EP0812681A1] The printing press has several inking units on a common impression cylinder (12). The printing press further comprises rollers (16,18) held in two bearing blocks (22) radially relative to the impression cylinder, and with one end in a folding bearing (42) and the other in a holder. The folding bearing, in the opened state, is open in the movement direction of the corresponding bearing block. It can be moved by moving this bearing block in the radial direction relative to the impression cylinder, thus enabling the roll bodies to be removed axially.
